

AOTF-1049

## Acousto-Optic Tuneable Filter

Features:
Fast Tuning
Minimal chromatic dispersion

RF Input
The AOTF-1049 acousto-optic tuneable filter is specifically designed for use with laser sources.
The wavelength of the diffracted light is selected according to the frequency of the RF drive signal. Isometgrown tellurium dioxide ( $\mathrm{TeO}_{2}$ ), which has been oriented for off-axis mode operation, is utilised as the interaction material. Fast access times and fine spectral bandwidths make these filters ideal for selecting discrete lines from a multi-line laser source.

For horizontal input polarization, the crystal geometry is designed to minimize chromatic beam deflection of the +1 st output. Diffracted output polarization rotated to vertical.

Typical tuning characteristic

Suitable electronics include:

- iSK3-100T-1 integrated frequency synthesizer / power amplifier.
- iMS4-L (or-P) fully programmable frequency synthesizer plus AG0-series amplifier.
